

Abstract of the Disclosure

A computer network (10) uses a central database (48) to manage a portfolio of real property holdings. The real property information related to the portfolio is stored on the central database and organized into a plurality of information categories. A computer hosts a website (60) for users to access the central database and view one or more categories of the real property information. Each authorized user can edit the real property information and save the edited real property information back to the central database. Other users access the edited real property information from the central database. The central database can also be used to compile real property information for offering as collateral in a loan package. The lender is given access to the real property information through the website. The real property information as selected for review by the lender is made available on the website.
